

Perfect. 👍

Now **don't run anything else yet**. We'll do this in controlled checkpoints so if something fails, we know exactly where.

Step 1 — Open PowerShell in the extracted project

Go to the folder containing:

pyproject.toml

README.md

docker-compose.yml

qa_platform\

scripts\

tests\

For example:

```
cd C:\path\to\autonomous_game_qa_production_core_v0.6
```

Verify:

```
dir
```

You should see at least:

pyproject.toml

README.md

docker-compose.yml

qa_platform

scripts

tests

Then run only this:

```
python --version
```

Send me the output.

Don't create the virtual environment or install anything yet. We'll verify Python first, then proceed to Step 2.

Great. Next checkpoint: **create the isolated Python environment.**

From the same project folder, run:

```
python -m venv .venv
```

Then activate it:

```
.\.venv\Scripts\Activate.ps1
```

Your prompt should change to something like:

```
(.venv) PS C:\...\autonomous_game_qa_production_core_v0.6>
```

Then verify:

```
python --version
```

```
pip --version
```

Stop there and send me the output. Don't install dependencies yet.
